

CLICK-KAAR Lens Project Brief

Overview

CLICK-KAAR Lens is an Angular 18 single-page web application for booking photography, visual content, and creator-production services. It presents occasion and business shoot categories, supports enquiry capture, showcases ideas and blog content, and provides login/register entry points for future account workflows.

Business Purpose

The app acts as a customer-facing photography marketplace module for CLICK-KAAR LLP. It helps users explore shoot services, understand available categories, submit requirements, contact the team through forms or WhatsApp, and browse planning content before booking.

Current Routing

The application is mounted at the site root. Primary routes include Home, Services, Occasions, Business, Ideas, Blog, About, Contact, Login, Register, Partners, Join roles, and Legal pages. SPA refresh support is configured through Vercel rewrites and Netlify-style _redirects.

Technology Stack

Angular 18 standalone components, Angular Router, Reactive Forms, RxJS, TypeScript 5.5, SCSS styling, Karma/Jasmine test setup, and static assets under src/assets and public. The app is API-ready but can run with mock lead submission based on environment settings.

Core Features

Customer Experience

The home page includes a hero, quick requirement form, popular services, service discovery, why-choose-us content, customer reviews, and a review submission UI. Navigation is responsive and mobile selections now close the menu after a link is selected.

Service Catalogue

The catalogue is data-driven. Occasion categories include Wedding, Pre-Wedding, Maternity, Baby and Kids, Vacation, and Birthday/Parties. Business categories include Food Photography, Interior Photography, Product Photography, Corporate Events, Brand Videos, and Profile/Headshots.

Forms and Lead Flow

Reusable enquiry and requirement forms validate Indian mobile numbers, required fields, preferred dates, consent, and message length. LensLeadService submits to configured backend endpoints when available, otherwise it returns delayed mock responses for frontend testing.

Authentication Screens

Login and Register pages are present as UI-ready forms. They validate user input and are prepared for future authentication API integration. Both use the existing visual language and shared auth layout.

Content and SEO

Content is centralized in lens-content.data.ts. LensSeoService updates page titles, descriptions, Open Graph tags, canonical links, Twitter card metadata, and optional JSON-LD schema for richer search presentation.

Implementation Notes

Reusable UI

Shared standalone components include section headings, image cards, stats counters, gallery grid with modal preview, enquiry form, post requirement form, and floating WhatsApp contact. Scroll reveal directives add lightweight motion.

Deployment

The production build outputs to `dist/click-kaar-lens`. `vercel.json` rewrites all requests to `index.html` for client-side routing. `public/_redirects` provides an equivalent fallback for Netlify-style static hosting.

Assets

Brand logos, service artwork, OG images, and photography visuals live under `src/assets/images`. The floating WhatsApp button uses an inline brand glyph. The login/register visual uses the photographer/camera asset.

Known Next Steps

Connect login/register to real authentication, replace placeholder Picsum gallery images with final portfolio assets, connect lead and partner forms to production APIs, verify business metrics, and expand tests around route behavior and form submissions.

Build Command

Use `npm.cmd` run build on Windows or `npm run build` in a standard shell. The latest build completed successfully during brief generation.
